   The present invention relates to novel Streptococcus agalactiae nucleotide sequences (1; ADV87607-ADV87745) and novel polypeptides (II; ADV87745-ADV89760). The nucleotide sequences encode polypeptides of S. agalactiae involved in the synthesis of amino acids, cell membranes, intermediate (central) metabolism, energetic metabolism, fatty acid and phospholipid metabolism, nucleotide metabolism, replication, pyrimidines and/or nucleosides, regulatory functions, replication, translation, protein transport, adaptation to atypical conditions, sensitivity to medicines and/or analogues, functions related to transposons, blosynchesis of cofactors, prosthetic groups and transporters, cell membrane proteins and cellular machinery. (I) are useful for the detection and/or amplification of nucleic acids. Pharmaccutical composition comprising (I) or (II) are useful for

The present invention relates to novel Streptococcus agalactiae nucleotide sequences (1; ADV78860-ADV78998 and ADV83341-ADV85476) and nucleotide sequences (1; ADV78999-ADV81203 and ADV831205-ADV83340). The nucleotide sequences encode polypeptides of s. agalactiae involved in the synthesis of amino acids, cell membranes, intermediate (central) metabolism, energetic metabolism, fatty acid and phospholipid metabolism, nucleotide metabolism including purines, pyrimidines and/or nucleosides regulatory functions, replication, transcription, translation, protein transport, adaptation to atypical conditions, sensitivity to medicines

3: pir3:\*

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

   This sequence represents a Streptococcus pneumoniae protein of the invention. The proteins (or their homologues, derivatives and/or fragments) are useful as immunogens or antigens. Immunogento or antigenic compositions comprising the proteins are useful for the detection or diagnostic assays. The sequences are useful for the detection or diagnostis of S. pneumoniae infection, by contacting a sample to be tested with them. Agents capable of antegonising, inhibiting or interfering with the function or expression of the protein or polypeptide are useful in medical compositions in the treatment or prophylaxis of S. pneumoniae infection. As the sequences can be used to treat S. pneumoniae infection, the bused to treat bacterial pneumonia, which has high rates in young children, the elderly, and in patients with predisposing conditions such as asplenia, heart, lung and kidney disease, diabetes, alcoholism,

  New proteins and nucleic acid molecules from Streptococcus pneumoniae, useful as medicaments for treating or preventing a disease or infection due to streptococcus bacteria, such as pneumonia, sepsis, otitis media or ear infection.
   The invention relates to a protein comprising or having at least 50% identity to any of the 2469 amino acid sequences, identified in the specification (available on a computer readable format), or its fragment, expressed from 2469 of 2489 identified DNA coding regions from the Streptococcus pneumoniae type 4 strain genomic sequence appearing as ABS56454. Also included are an antibody which binds one of the proteins, treating a patient by administering the protein. DNA or antibody (in a composition), a kit comprising first and second primers, which are the nucleic acid cited above or fragments between nucleocides 8-100 of a sequence not defined in the specification, for amplifying a target

This invention relates to novel nucleic acids encoding hyperimmune serum cactive antigens selected from peptides and serum reactive epitopes that can be used in pharmaceutical compositions that exhibit antibacterial activity. The present invention describes a composition (including the nucleic acid molecule, hyperimmune serum-reactive antigen or antibody) that is useful for manufacturing a medicament such as a vaccine, which can be used to treat or prevent bacterial infections, particularly S. Decemberia infections that cause pharyngitis, office media, pneumonia, be used for isolating, purifying and/ or identifying an interaction partner of the hyperimmune serum reactive antigen, as well as for manufacturing a functional nucleic acid selected from aptemers and spiegelmers or for manufacturing a functional ribonucleic acid selected from abcamers and spiegelmers or for manufacturing a functional ribonucleic acid selected from thosymee, antisense nucleic acids and siRNA. This polypeptide acids antigen accept the active antigen reactive antigen reactive antigen reactive antigen reactive antigen reactive antigen reactive antigen reactive antigen reactive antigen accepts.

The present sequence represents a protein from Streptococcus pneumoniae. The uncleic acid sequence encoding the Streptococcus pneumoniae protein can be useful in vaccines for inducing protective antibodies against Streptococcus pneumoniae, for traducing protective antibodies against Streptococcus pneumonia, oftils media or meningitis. Probes based on the nucleic acid are used to detect Streptococcus infection (by usual hybridisation or amplification methods), also for isolating Streptococcus genes or their allelic variants. The protein can be used similarly to detect specific antibodies in standard immunoassays, especially for diagnosing or monitoring infections. Antibodies which bind the protein are used to detect corresponding antigens, to purify the protein and for passive immunisation (optionally coupled to a toxin). Vaccines are administered, e.g. by injection, orally or through the skin, typically at 0.01-1000

  The invention relates to an isolated polynucleotide consisting of a Streptococcus pneumoniae nucleic acid (appearing as ADC45122 and encoding SP028) one of 113 disclosed nucleic acids encoding 113 S. pneumoniae antigens. Also included are making a recombinant vector by inserting the nucleic acid into a vector, an isolated polynucleotide consisting of at least 50 or 100 contiguous nucleotides of the SP028 polynucleic acid, and a recombinant host cell comprising the SP028 polynucleotide. The nucleic acids are useful as DNA vaccine against Streptococcus pneumoniae infection (e.g. pneumonia). Nucleic acids derived from the S. pneumoniae antigen nucleic acids are useful as probes for use in diagnostic methods for detecting S. pneumoniae agene expression. The present sequence

  ABQ84792 to ABQ84904 represents nucleic acids which encode the Streptococcus pneumoniae antigens given in ABP54557 to ABP54669. The S. pneumoniae antigens have antibacterial activity and can be used in vaccines. The S. pneumoniae antigens can also be used to prevent or attenuate a Streptococcal infection in an animal. The polymucleotides encoding the S. pneumoniae antigens can be used to detect Streptococcus nucleic acids. ABQ84905 to ABQ85130 represent primers used in the cloning of S. pneumoniae ORPs (open readding frames) which are used in an example from the present invention
  New Streptococcus pneumoniae antigens, useful for detecting Streptococcus and for preventing or attenuating disease caused by Streptococcus

AAH52104 to AAH53970 represent nucleic acids (I) encoding polypeptides (II), given in AAG8154 to AAG83120, from Staphylococcus epidermidis. (I) and have antibacterial activity and therefore can be used in vaccination. The nucleic acids (I) may be used to produce the S. epidermidis polypeptides (II) wis the production of vectors containing them which are used to produce hosts cells which express the bolypeptides (II) wis the production of vectors containing polypeptides. The polypeptides (II) (and/or nucleic acids) may then be used to vaccinate subjects and to raise antibodies against the bacteria. The polypeptides may also be used to sasay for other inhibitors of their activity and therefore identify compounds that may be used for the treatment of S. epidermidis infections, e.g. endocarditis. AAH53971 to AAH55091 represent specifically claimed S. epidermidis genomic DNA polynucleotide sequences from the present invention. AAH55091 to AAH55091 complement of the present invention. AAH55091 to AAH55091 complement of the present invention. Becent invention of sequence listing of the present invention, however the sequence sequence of listing of the present specification, however the sequence in the disclosure for SEQ ID NO:4455 to 4472, no sequences are present in the disclosure for SEQ ID NO:4455 to 4472, no sequences are present

   The present invention relates to the protection against malaria. More particularly, the invention pertains to a family of MSP-3 (merozoite surface protein 3)-like genes (MSP-3-1, MSP-3-3, MSP-3-3, MSP-3-3, MSP-3-4, MSP-3-5, MSP-3-6, MSP-3-7 and MSP-3-9) located on chromosome 10 of Plasmodium falciparum, highly conserved in P. falciparum strains, simultaneously expressed in P. falciparum at the erythrocytic stages and encoding proteins which have a Asn-Leu-Arg-Asn or Asn-Leu-Arg-Lys signature at their N-terminal extremity and which are located at the merozoite unface. The characterization of this gene family enables the definition of immunogenic and vaccine compositions against P. falciparum. The present sequence is the P. falciparum MSP-3-1 protein.

The invention relates to an isolated nucleic acid comprising any one of the 6213 antisense sequences given in the specification where expression of the nucleic acid inhibits proliferation of a cell. Also included are:

(1) a vector comprising a promoter operably linked to the nucleic acid conceding a polypeptide whose expression is inhibited by the antisense nucleic acid; (2) a host cell containing the vector; (3) an isolated polypeptide or its fragment whose expression is inhibited by the antisense nucleic acid; (4) an antibody capable of specifically binding the polypeptide; (5) inhibiting cellular proliferation or the activity of a gene in an operon required for proliferation or the activity of a gene in an operon required for che gene product or that has an activity against a biological pathway required for proliferation, or that inhibits cellular proliferation; (8) identifying a gene required for cellular proliferation or the biological pathway in which a proliferation, or that inhibits proliferation of an organism acts; (9) manufacturing an antibiotic; (10) profiling a compound sectivity; (11) a culture comprising strains in which the gene product is overexpressed or underexpressed; (12) determining the extent to which each of the strains is present in a culture or collection of strains; or (13) identifying the target of a compound that inhibits the critical collection of strains; or (13) identifying proteins or screening for homologous nucleic acids are useful for for discourt when the proliferation of an organism. The antisense nucleic acids are useful for for discourt when the proliferation or for strains in which a proliferation or for severalization or for severalization or for severalization or for severalization or for severalization or for severalization or for severalization or severalization or for severalization or severalization or for severalization or severalization.
  drug discovery programs, or for screening homologous nucleic acids required for proliferation in cells other than S. aureus, S. typhimurium, K. pneumoniae or P. aeruginosa. The present sequence is encoded by one of the target prokaryotic essential genes. Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at

The invention relates to a chimeric molecule that comprises a glutamaterich protein (GLURP) moiety consisting of a polypeptide fragment (amino acid residues 25-514) of GLURP (given as SEQ ID No:1) and a Merozoite surface protein 3 (MSP3) moiety consisting of amino acid residues 212-380 of MSP3 (given as SEQ ID No:2), wherein the chimeric molecule rasises antibodies against both polypeptides in mice immunized with it. Also cascribed are: (i) a conjugate comprising the chimeric molecule of the invention bound to a solid support, (ii) an immunogenic composition comprising the chimeric molecule, the conjugate described above, or a mixture of GLURP and MSP3 antigens as an immunogen, (iii) a vaccine against malaria comprising the chimeric molecule, the conjugate described above, or a mixture of GLURP and MSP3 antigens as an immunogen, in association with a suitable vehicle, (iv) use of purified and/or cecombinant anti-MSP3 and anti-GLURP antibodies, for the preparation of a medicament against malaria, and (v) a medicament for passive immunotherapy of malaria, comprising the invention or a mixture of GLURP and MSP3 antibodies. The chimeric molecule of the invention or a mixture of GLURP and MSP3 antibodies.

  an
   The present invention relates to a fusion protein comprising Plasmodium falciparum glutamate-rich protein (GLURP) coupled to P. falciparum merozoite surface protein 3 (MSP3). The GLURP-MSP3 fusion protein is useful as an antigen based vaccine against malaria. Also disclosed polynucleotide sequence encoding the GLURP-MSP3 fusion protein. The polynucleotide sequence is also useful in preparing a vaccine. The vaccine is useful in treating and preventing malaria and for inducing an immune response against malaria. The present sequence represents P. falciparum GLURP-MSP3 hybrid.

The invention relates a recombinant DNA construct comprising a polymucleotide having any of 5544 nucleotide sequences (CDNAs SEQ ID NO: 1-5544) and encoding a polymeptide with any of 5544 amino acid sequences (SEQ ID NO: 5545-1108). The CDNAs and proteins are from corn, soybean, Arabidopsis, wheat and rape but the specification does not indicate which sequences is derived from which organism. Also included is a method of producing a plant having an improved property, comprising transforming a plant a recombinant DNA construct comprising a promoter region functional in a plant cell operably joined to a polymucleotide encoding a polymetide associated with the property, and growing the transformed
   New recombinant DNA constructs useful in the field of biochemistry and genetics, and in particular for producing transgenic plants with improved biological characteristics.
and MSP3 antigens are useful for the preparation of a vaccine composition against malaria. This sequence represents Plasmodium falciparum MSP3a to MSP3 fragment. Note: The present sequence given as SEQ ID No:7 in the Sequence Listing is not mentioned elsewhere in the specification.

```
The present inneration describes proteins and train iragments [1] encoded by chromosome 2 of the human malarial parasite, Plasmodium falciparum.

Also described are: (1) nucleotide sequences (II) encoding (I); and (2) of accines against P. falciparum infection comprising (I) or (II). (I) and (II) are useful for the development of vaccines against P. falciparum compression of infection. (I) and polyclonal antisers or a monoclonal antibody raised to immunogens comprising the sequences of (I), are useful in the detection of infection with P. falciparum. Purhermore, (I) (especially when they are rifins or secreted or membrane proteins) can aid the identification of drugs to treat or prevent P. falciparum. Sequencing of the confleming of the plasmodium chromosome 2 and the subsequent identification of proteins canceded by it will help to expand our understanding of parasite biology, a process hampered by the complexity of the parasitic lifecycle, and concoded by it will help to expand our understanding of parasite resistance to drugs and mosquito resistance to insecticides have led to a resurgence of malaria in many parts of the world, and there is a pressing need for represent nucleotide and protein sequences given in the present conception, but which are not specifically mentioned within the specification.

  The present invention relates to a method for identifying candidate proteins in pathogens useful as anti-infectives. The invention discloses a computational method which involves the calculation of several sequence attributes and their subsequence analysis results in the identification of outlier proteins in different pathogens. The method is useful for the identification of outlier proteins (e.g. virulence proteins, antigens or proteins used as drug targets) in pathogenic organisms. The method of the invention provides reproducible results as it does not depend on the variable biochemical characteriaation of proteins. AB023500-AB0233617 represent outlier proteins identified from different pathogenic organisms

The invention relates to a chimeric molecule that comprises a glutamaterich protein (GLURP) moiety consisting of a polypeptide fragment (amino acid residues 25-514) of GLURP (given as SEQ ID No:1) and a Merozoite surface protein 3 (MSP3) moiety consisting of amino acid residues 212-380 of MSP3 (given as SEQ ID No:2), wherein the chimeric molecule raises antibodies against both polypeptides in mice immunized with it. Also described are: (i) a conjugate comprising the chimeric molecule of the invention bound to a solid support, (ii) an immunogenic composition comprising the chimeric molecule, the conjugate described above, or a mixture of GLURP and MSP3 antigens as an immunogen, (iii) a vaccine above, or a mixture of GLURP and MSP3 antigens as an immunogen, in association with a sustable vehicle, (iv) use of purified and/or recombinant anti-MSP3 and anti-GLURP antibodies, for the preparation of a medicament against malaria, and (v) a medicament for passive immunotherapy of malaria, comprising the anti-MSP3 and anti-GLURP antibodies. The chimeric molecule of the invention or a mixture of GLURP antibodies. The chimeric molecule of the invention or a mixture of GLURP and MSP3 antigens are useful for the preparation of a vaccine composition against malaria. This sequence represents Plasmodium falciparum MSP3 protein (amino acid residues 212-330).

The invention relates to an isolated nucleic acid comprising any one of the 6213 antisense sequences given in the specification where expression of the nucleic acid inhibits proliferation of a cell. Also included are:

(1) a vector comprising a promoter operably linked to the nucleic acid concerned and promoter operably linked to the nucleic acid concerned and is inhibited by the antisense nucleic acid; (2) a host cell containing the vector; (3) an isolated polypeptide or its fragment whose expression is inhibited by the antisense nucleic acid; (4) an antibody capable of specifically binding the polypeptide; (6) inhibiting cellular proliferation or the activity of a gene in an operon required for proliferation or the activity against a biological pathway required for proliferation, or that inhibits cellular proliferation; (8) identifying a gene required for cellular proliferation or the biological pathway in which a proliferation-required gene or the biological pathway in which a proliferation-required gene or the biological pathway in which a proliferation-required gene or the biological or a gene on which the test compound that inhibits proliferation of an organism acts; (9) manufacturing an antibiotic; (10) proffiling a compound sectivity; (11) a culture comprising strains in which the gene product is overexpressed or underexpressed; (12) determining the extent to which each of the strains is present in a culture or collection of strains; or (13) identifying the target of a compound that inhibits to collection of strains; or (13) identifying the target of a compound that inhibits collection of strains; or claiming proteins or screening for homologous nucleic acids are useful for dentifying proteins or solection and descreening for homologous nucleic acids are useful for dentifying a proliferation to solected account dispersed and descreening for minimal account and descreening for dentifying a proliferation of solected account dentifying account dentifying account dentifying account dentifying account dentif
   New antisense nucleic acids, useful for identifying proteins or screening for homologous nucleic acids required for cellular proliferation to isolate candidate molecules for rational drug discovery programs.
  drug discovery programs, or for screening homologous nucleic acids required for proliferation in cells other than S. aureus, S. typhimurium, K. pneumoniae or P. aeruginosa. The present sequence is encoded by one of the target prokaryotic essential genes. Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at ftp.wipo.int/pub/published_pct_sequences

   capable of detecting 1000 or more genes from brosophila. The invention useful in developmental biology and in elucidating cell signalling and cell-cell interactions in higher eukaryotes for the development of insecticides, therapeutics and pharmaceutical drugs. The invention discloses genomic DNA sequences (ABL16176-ABL30511), expressed DNA sequences (ABL01840-ABL16175) and the encoded proteins (ABB57737-ABB27072). The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at ftp.wipo.int/pub/published_pct_sequences

  The present invention describes 23 human molecules for disease detection and treatment (MDDT-1 to 23) (see ABP55392 to ABP55414). The human MDDT-1 to 23) (see ABP55392 to ABP55414). The human MDDT-1 CC to 23 proteins (1) are encoded by the sequences given in ABQ83889 to ABQ83881. (1) can have various activities depending on the cells and tissues in which they are expressed. These activities include: anti-HIV; cn antializamatory; antianaemic; antiparkinsonian; nootropic; antializamatory; antiantericinscleoric; antializamator; cn antialabetic; nethinfertility; antiarterioscleoric; antialathmatic; immunosuppressive; antithyroid; cytostatic; hepatotropic; dermatological; antiarterioscleoric; antibactective; corecopathic; antiarterhritic; antiparestic; antibacterial; corecopathic; popthalmological; antirhematic; and the polymucleotides; corecoding them can be used in gene therapy. (1), polymucleotides, agonists conding them can be used in gene therapy. (1), polymucleotides, agonists and antagonists from the present invention can be used for diagnosing. CMDT, particularly cell proliferative (e.g. cancer), developmental disorders, neurological disorders reproductive disorders, or autoimmune/inflammatory disorders, or viral, bacterial, fungal, cu autoimmune/inflammatory disorders, or viral, bacterial, fungal, parasitic, protozoal or helminthic infections. They are also useful in the assessment of the effects of exogenous compounds on the expression of cut and amino acid sequences of proteins associated with MDDT
   Human; MDDT; molecules for disease detection and treatment; anti-HIV; antiallergic; antinflammatory; antianaemic; antiparkinsonian; nootropic; anticonvulsant; antiinflammatory; antianaemic; antibackhmatic; immunosuppressive; antithyroid; cytostatic; hepatotropic; dermatological; antidabetic; nephrotropic; antipout; thyromimetic; neuroprotective; osteopathic; antiarthritic; antiparasitic; antihelminthic; antipacteria; uropathic; opthhalmological; antiheumatic; haemostatic; antibacterial; virucide; protozoacide; fungicide; gene therapy; cell proliferative; cancer; developmental disorder; neurological disorder; infection; reproductive disorder; autoimmune disorder; inflammatory disorder.

The present sequence is that of a Staphylococcus aureus protein ORF0657n hybrid polypeptide. This is an example of claimed hybrid polypeptide timmunogens of the invention ADM88439-ADW88474 that comprise a modified S. aureus ORF0657n sequence ADW88431-ADW88438 containing amino acid substitutions that increase sequence similarity to ORF0190 ADW88432. The hybrid polypeptides contain one or more epitopes for ORF0657n and ORF0190 protein sequences. The convention also provides nucleic acids encoding these hybrid polypeptides, and a method for evaluating the ability of an immunogen to produce a protective immune response against Staphylococcus infection using an animal (mouse or rat) model. The hybrid polypeptides having therapeutic and diagnostic applications, such as being used to provide protective immunity against S. aureus infection, being used to generate antibodies to detect the presence of S. aureus, and being used to generate antibodies therapeutic antibodies that target S. aureus.

The invention relates to an isolated nucleic acid comprising any one of
the 6213 antisense sequences given in the specification where expression
cc of the nucleic acid inhibits proliferation of a cell. Also included are:
(1) a vector comprising a promoter operably linked to the nucleic acid
cnoclaid acid; (2) a host cell containing the vector; (3) an isolated
conclaid acid; (4) an antibody capable of specifically binding
polypeptide or its fragment whose expression is inhibited by the
antisense nucleic acid; (4) an antibody capable of specifically binding
confiseration or the activity of a gene in an operon required for
proliferation or the activity of a gene in an operon required for
proliferation; (7) identifying a compound that influences the activity of
the gene product or that has an activity against a biological pathway
cc required for proliferation, (8)
the gene product or that has an activity against a biological pathway
cc required for proliferation.
cproliferation or the compound that inhibits proliferation of an
craphway in which a proliferation-required gene or its gene product lies
cc a gene on which the test compound that inhibits proliferation of an
craphway in which a proliferation-required gene or its gene product lies
cc a gene on which the test compound that inhibits the
cc compound's activity; (11) a culture comprising strains in which the gene
cc product is overexpressed or underexpressed; (12) determining the extent
cc product is overexpressed or underexpressed; (12) determining the extent
cc proliferation of an organism. The antisense nucleic acids are useful for
identifying proteins or screening for homologous nucleic acids required
  screening

The invention relates to the isolation of novel genes (ACF3446-ACF34559)

conciding proteins (ABR64180-ABR64281) involved in the process of
anglogenesis. The nucleic acid molecules are useful in identifying and/or
cobtaining full-length human genes involved in an anglogenic process. The
nucleic acid molecule, polypeptides or complexes encoded, cells or
conceicially modified non-human animals derived from these are useful for
conceicially modified non-human animals derived from these are useful for
conceicating of candidate pharmaceutical compounds used in tracting
anglogenesis-related disorders. They are also useful for diagnosing,
conceicating or treating an anglogenesis or is a disorder, which
a decreased vasculature is of benefit (e.g. cancer, rheumatoid arthritis,
conceileroshs), or involves inappropriately arrested or decreased
canglogenesis or is a disorder in which an expanding vasculature is of
conceit (e.g. ischemic limb disease or coronary arrery disease). The
conceic acid sequence is useful for manufacturing a medicament for the
creatment of an anglogenesis-related disorder. This sequence corresponds
conceing the novel anglogenic protein

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

New vaccines comprising Sp128 or Sp130 polypeptides, for treating and preventing pneumococcal infections, particularly infections caused by Streptococcus, e.g. otitis media, nasopharyngeal, bronchial, lung or blood infections.

Claim 8; Page 51-54; 54pp; English.

The invention relates to novel immunogenic polypeptides, Sp128 and Sp130 from S. pneumoniae. Vaccines comprising the polypeptides are useful for the treatment and prevention of pneumococcal infections, particularly infections caused by Streptococcus, such as otitis media, nasopharyngeal, bronchial, lung or blood infections. The antigens are used as immunogenic agents to stimulate an immune response. The antisera and antibodies may also be used in diagnosing and treating pneumococcal infections. Recombinant polypeptides serve as a mechanism for stimulating production of antibodies for use in passive immunotherapy, diagnostic reagents, and

   This sequence represents a Streptococcus pneumoniae protein of the invention. The proteins (or their homologues, derivatives and/or fragments) are useful as immunogens or antigens. Immunogenic or antigenic compositions comprising the proteins are useful as vaccines and also in diagnostic assays. The sequences are useful for the detection or diagnosts of S. pneumoniae infection, by contacting a sample to be tested with them. Agents capable of anteonomy, inhibiting or interfering with the function or expression of the protein or polypeptide are useful in medical compositions in the treatment or prophylaxis of S. pneumoniae infection. As the sequences can be used to treat S. pneumoniae infection, the older to treat bacterial pneumonia, which has high rates in young children, the alderly, and in patients with predisposing conditions such as asplenia, heart, lung and kidney disease, diabetes, alcoholism,

New proteins and nucleic acid molecules from Streptococcus pneumoniae, useful as medicaments for treating or preventing a disease or infection due to streptococcus bacteria, such as pneumonia, sepsis, otitis media or ear infection.
  The invention relates to a protein comprising or having at least 50% identity to any of the 2469 amino acid sequences, identified in the specification (available on a computer readable format), or its fragment, expressed from 2469 of 2489 identified BNA coding regions from the Streptococcus pneumoniae type 4 strain genomic sequence appearing as ABS56454. Also included are an antibody which binds one of the proteins, treating a patient by administering the protein. BNA or antibody (in a composition), a kit comprising first and second primers, which are the nucleic acid cited above or fragments between nucleotides 8-100 of a sequence not defined in the specification, for amplifying a target

sequence contained within a Streptococcus nucleic acid sequence, where
the first primer is substantially complementary to the target sequence
and the second primer is substantially complementary to the complement of
the target sequence, and where the parts of the primers having
substantial complementarity define the termini of the target sequence to
be amplified, assay comprising contacting a test compound with the
protein, and determining whether the test compound binds to the protein
cond as Streptococcus pneumoniae bacterium, where one or more genes
encoding the proteins has been rendered inactive. The proteins, nucleic
acid molecules, antibody and compositions are useful as medicaments for
treating or preventing a disease or infection due to streptococcus
bacteria, particularly S. pneumoniae, such as pneumonia, sepsis, otitis
media or ear infection. They are also useful in developing vaccines,
diagnostics and antibiotics. The methods are useful for identifying
immunodominant proteins. The present sequence is one of the 2469 proteins
expressed by the identified coding regions from the genomic sequence.
Note: The sequence data for this patent did not form part of the printed
specification, but was obtained in electronic format directly from WIPO
at figh wipo.int/pub/published_pot_sequences. (Updated on 23-OCT-2003 to

This invention relates to novel nucleic acids encoding hyperimmune serum reactive antigens selected from peptides and serum reactive epitopes that can be used in pharmaceutical compositions that eachibit antibacterial activity. The present invention describes a composition (including the nucleic acid molecule, hyperimmune serum-reactive antigen or antibody) that is useful for manufacturing a medicament such as a vaccine, which can be used to treat or prevent bacterial infections, particularly S. pneumoniae infections that cause pharymoitis, otitis media, pneumonia, be used for isolating, purifying and/ or identifying an interaction partner of the hyperimmune serum reactive antigen, as well as for manufacturing a functional nucleic acid selected from abcamers and spiegelmers or for manufacturing a functional ribonucleic acid selected from athoxymes, antisense mucleic acids and siRNA. This polypeptide sequence is a Streptococcus pneumoniae hyperimmune serum reactive antigen

The invention relates to an isolated nucleic acid molecule for detecting, preventing or treating pathological conditions resulting from bacterial infection. The isolated nucleic acid comprises: (a) any of the 2603 nucleotide sequences of AEA55236 to AEA57838; (b) a nucleotide sequence corrected sequences of AEA57339 to AEA6441; or (c) a nucleotide sequence corrected sequences of AEA57339 to AEA6441; or (c) a nucleotide sequence of a least 8 nucleotides in length, where the sequence is chybridizable to a nucleic acid having any of the nucleotide sequence is chybridizable to a nucleic acid having any of the nucleotide sequence is chybridizable to a nucleic acid operably linked to a transcription regulatory element; (a) a cell comprising the recombinant expression vector comprising the above nucleic acid operably linked to a transcription regulatory element; (c) a cell comprising the recombinant expression vector; (3) producing an S. pneumoniae polypeptide; (4) a probe comprising a nucleotide sequence consisting of at least 8 nucleotides of any of AEA57838; (5) creating a subject for S. pneumoniae infection; (6) a recombinant or substantially pure preparation of an S. pneumoniae polypeptide or its fragment, where the polypeptide is selected from AEA57839 to AEA6041; (7) a vaccine composition for preventing or treating an amount of the above nucleic acid in a sample; (6) a computation, comprising an amount of the above nucleic acid in a sample; (7) a vaccine composition and methods are useful for diagnosting or treating or fragments of the Streptococcus genome of commercial importance. The composition and methods are useful for diagnosing, preventing or treating because represents a S. pneumoniae of sequence from the sequence represents a S. pneumoniae of present invention. Note - The sequence data for this patent did not form directly from the USPTO web site.

The present sequence represents a protein from Streptococcus pneumoniae. The nucleic acid sequence encoding the Streptococcus pneumoniae protein and be useful in vaccines for inducing protective antibodies against Streptococcus pneumoniae, for treatment or prevention of infection e.g. pneumonia, otitis media or meningitis. Probes based on the nucleic acid are used to detect Streptococcus infection (by usual hybridisation or amplification methods), also for isolating Streptococcus genes or their allelic variants. The protein can be used similarly to detect specific antibodies in standard immunoassays, especially for diagnosing or monitoring infections. Antibodies which bind the protein are used to detect corresponding antigens, to purify the protein and for passive immunisation (optionally coupled to a toxin). Vaccines are administered, e.g. by injection, orally or through the skin, typically at 0.01-1000

The invention relates to an isolated polynucleotide consisting of a Streptococcus pneumoniae nucleic acid (appearing as ADC45122 and encoding SP028) one of 113 disclosed nucleic acids encoding 113 s. pneumoniae antigens. Also included are making a recombinant vector by inserting the nucleic acid into a vector, an isolated polynucleotide consisting of at least 50 or 100 contiguous nucleotides of the SP028 nucleic acid, and a recombinant host cell comprising the SP028 polynucleotide. The nucleic acids are useful as DNA vaccine against Streptococcus pneumoniae infection (e.g. pneumonia). Nucleic acids derived from the S. pneumoniae antigen nucleic acids are useful as probes for use in diagnostic methods for detecting S. pneumoniae agene expression. The present sequence

  ABQ84792 to ABQ84904 represents nucleic acids which encode the Streptococcus pneumoniae antigens given in ABP54557 to ABP54669. The S. pneumoniae antigens have antibacterial acitivity and can be used in vaccines. The S. pneumoniae antigens can also be used to prevent or attenuate a Streptococcal infection in an animal. The polymucleotides encoding the S. pneumoniae antigens can be used to detect Streptococcus nucleic acids. ABQ84905 to ABQ85130 represent primers used in the cloning of S. pneumoniae ORPs (open reading frames) which are used in an example from the present invention
  New Streptococcus pneumoniae antigens, useful for detecting Streptococcus and for preventing or attenuating disease caused by Streptococcus infection.

The invention relates to a chimeric molecule that comprises a glutamaterich protein (GLURP) molety consisting of a polypeptide fragment (amino acid residues 25-514) of GLURP (given as SEQ ID No:1) and a Merozoite surface protein 3 (MSP3) molety consisting of amino acid residues 212-380 of MSP3 (given as SEQ ID No:2), wherein the chimeric molecule raises artibodies against both polypeptides in mice immunised with it. Also described are: (i) a conjugate comprising the chimeric molecule of the invention bound to a soild support, (ii) an immunogenic composition composition to a soild support, (ii) an immunogenic composition of invention bound to a soild support, (ii) an immunogenic composition of a mixture of GLURP and MSP3 antigens as an immunogen, (iii) a vaccine against malaria comprising the chimeric molecule, the conjugate described above, or a mixture of GLURP and MSP3 antigens as an immunogen, in association with a suitable vehicle, (iv) use of purified and/or recombinant anti-MSP3 and anti-GLURP antibodies, for the preparation of a mixture of GLURP and MSP3 antigens as an immunogen, in association with a suitable vehicle, (iv) use of purified and/or included malaria, and (v) a medicament for passive comprising the anti-MSP3 and anti-GLURP antibodies. The chimeric molecule of the invention or a mixture of GLURP and MSP3 antigens are useful for the preparation of a vaccine composition against malaria. This sequence represents plasmodium falciparum MSP3 to the Sequence represents plasmodium falciparum MSP3 at the Sequence represents plasmodium falciparum MSP3 to the Sequence represents in the specification.

The present invention relates to the protection against malaria. More particularly, the invention pertains to a family of MSP-3 (merozoite surface protein 3)-like genes (MSP-3-1, MSP-3-2, MSP-3-3, MSP-3-3, MSP-3-6, MSP-3-6, MSP-3-6, MSP-3-6, MSP-3-7 and MSP-3-8) located on chromosome 10 of Plasmodium falciparum, highly conserved in P. falciparum strains, simultaneously expressed in P. falciparum at the erythrocytic stages and encoding proteins which have a Asn-Leu-Arg-Asn or Asn-Leu-Arg-Lys signature at their N-terminal extremity and which are located at the merozoite surface. The characterization of this gene family enables the definition of immunogenic and vaccine compositions against P. falciparum. The present sequence is the P. falciparum MSP-3-1 protein.

  Chimeric molecule useful for preparing vaccine composition against malaria, comprises glutamate-rich protein GLURP and Merozoite surface protein 3 MSP3 moieties, and raises antibodies against moieties in mice immunized with molecule.
   The invention relates to an isolated nucleic acid detection reagent capable of detecting 1000 or more genes from Drosophila. The invention useful in developmental biology and in elucidating cell signalling and cell-cell interactions in higher eukaryotes for the development of insecticides, therapeutics and pharmaceutical drugs. The invention discloses genomic DNA sequences (ABL16176-ABL30511), expressed DNA sequences (ABL16176-ABL30511), expressed DNA ABB72072). The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at ftp.wipo.int/pub/published_pct_sequences
  P. falciparum merozoite surface protein 3, amino acid residues 212-380.

The present invention relates to a fusion protein comprising Plasmodium falciparum glutamate-rich protein (GLURP) coupled to P. falciparum merozoite surface protein 3 (MSP3). The GLURP-MSP3 fusion protein is useful as an antigen based vaccine against malaria. Also disclosed is the polynucleotide sequence encoding the GLURP-MSP3 fusion protein. The polynucleotide sequence is also useful in preparing a vaccine. The vaccine is useful in treating and preventing malaria and for inducing an immune response against malaria. The present sequence represents P. falciparum GLURP-MSP3 hybrid.

The present interitors protective and there is a process of the following the present interitors are interitors by chromosome 2 of the human malarial parasite, Plasmodium falciparum.

Also described are: (1) nuclectide sequences (II) encoding (I); and (2) vaccines against P. falciparum infection comprising (I) or (II): (I) and (II): (I) and polyclonal antisera or a monoclonal antibody raised to immunogens comprising the sequences of (I), are useful in the detection of infection with P. falciparum. Furthermore, (I) (especially when they are rifins or secreted or membrane proteins) can aid the identification of infection with P. falciparum. Sequencing of the confidentity drug resistance in P. falciparum infection, or they can be used to identify drug resistance in P. falciparum. Sequencing of the plasmodium chromosome 2 and the subsequent identification of proteins concoded by it will help to expand our understanding of parasite biology, a process hampered by the complexity of the parasitic lifecycle, and provide new targets for vaccine and drug development. Parasite resistance to fundation and many parts of the world, and there is a pressing need for vaccines and new drugs. AAA70078 to AAA70287 and AAB18144 to AAB18352 crepresent nucleotide and protein sequences given in the present crepresent mucleotide and protein mentioned within the specification

   proteins in pathogens useful as anti-infectives. The invention discloses a computational method which involves the calculation of several sequence attributes and their subsequence analysis results in the identification of outlier proteins in different pathogens. The method is useful for the identification of outlier proteins (e.g. virulence proteins, antigens or proteins used as drug targets) in pathogenic organisms. The method of the invention provides reproducible results as it does not depend on the variable blochemical characterisation of proteins. AB023500-AB023517 represent outlier proteins identified from different pathogenic organisms

The invention relates to an isolated nucleic acid comprising any one of the 6213 antisense sequences given in the specification where expression of the mucleic acid inhibites proliferation of a cell. Also included are:

(1) a vector comprising spronder operably linked to the nucleic acid of a vector comprising bronder operably linked to the nucleic acid of promoter operably linked to the antisense nucleic acid; (4) an antibody capable by the antisense nucleic acid; (4) an antibody capable of specifically binding the polypeptide or its fragment whose expression is inhibited by the nucleic acid; (4) an antibody capable of specifically binding the polypeptide; (5) producing the polypeptide; (6) inhibiting cellular proliferation or that that a nation operon required for proliferation or that that a nation of the activity of the gene product or that has an activity against a biological pathway required for proliferation, (7) identifying a compound that inhibits proliferation; (8) identifying a gene required for cellular proliferation or the biological pathway in which a proliferation-required gene or its gene product lies pathway in which a proliferation-required gene or its gene product lies or a gene on which the test compound that inhibits proliferation of pathway in which a proliferation that inhibits proliferation of compound, a activity; (11) a culture comprising strains in which the gene product is overexpressed or underexpressed; (12) determining the extent to which each of the strains is present in a culture or collection of strains; or (13) identifying the target of a compound that inhibits the proliferation to isolate and and uncleic acids are useful for equality day discovery programs, or for screening for homologous nucleic acids required for required for proliferation to isolate and only an energine provary incereinal genes. Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from which each sequences.

  The invention relates to the isolation of novel genes (ACF3446-ACF34559) encoding proteins (ABR64180-ABR64281) involved in the process of angiogenesis. The nucleic acid molecules are useful in identifying and/or obtaining full-length human genes involved in an angiogenic process. The nucleic acid molecule, polypeptides or complexes encoded, cells or genetically modified non-human animals derived from these are useful for the screening of candidate pharmaceutical compounds used in treating angiogenesis-related disorders. They are also useful for diagnosing, prognosticating or treating an angiogenesis-related disorder, which involves uncontrolled or enhanced angiogenesis or is a disorder in which a decreased vasculature is of benefit (e.g. cancer, rheumatoid arthritis, diabetic retinopathy, psoriasis or cardiovascular diseases such as attentionally or involves inappropriately arrested or decreased angiogenesis or is a disorder in which an expanding vasculature is of benefit (e.g. ischemic limb disease or coronary artery disease). The mucleic acid sequence is useful for manufacturing a medicament for the reatment of an angiogenesis-related disorder. This sequence corresponds

specification, a method for identifying a compound useful in treating pain and a pharmacettical composition comprising the one or more polypeptides or their antibodies. The polynucleotide or the compound that modulates its activity is useful for preparing a medicament for treating pain (e.g. spinal segmental nerve injury (Chung), chronic constriction injury (CCI) and spared nerve injury (SNI) in an animal (e.g. gene the specification) which is differentially expressed during pain. Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic form directly from WIPO at ftp.wipo.int/pub/published_pct_sequences.
  The invention relates to a combination comprising cDNAs that are differentially expressed in response to steroid treatment. Also included are the following: a high throughput method for using a cDNA to detect differential expression of nucleic acids in a sample; and a high throughput method of screening molecules or compounds to identify a ligand that specifically binds a cDNA. The sample is from a subject with wilson disease and comparison of a standard defines a stage of that disease. The high throughput method of screening molecules or compounds to identify a ligand that specifically binds a cDNA comprises: combining the combination with molecules or compounds under conditions to allow

  The invention relates a recombinant DNA construct comprising a polymucleotide having any of 5544 nucleotide sequences (CDNAs SEQ ID NO: 1-5544) and encoding a polymethew with any of 5544 amino acid sequences (SEQ ID NO: 545-11088). The CDNAs and proteins are from corn, soybean, Arabidopsis, wheat and rape but the specification does not indicate which sequences is derived from which organism. Also included is a method of producing a plant having an improved property, comprising transforming a plant having an improved property, comprising transforming a plant with a recombinant DNA construct comprising transforming a plant with a plant cell operably joined to a polymerle encoding a colypeptide associated with the property, and growing the transformed plant. The property is selected from improving plant colls by modification of the cell cycle pathway, for improving plant drought tolerance, for providing increased resistance to plant disease, for galactomannan production, for production of plant tolerance to herbicides, for increasing the rate of improving plant tolerance to herbicides, for increasing the rate of homologous recombination in plants, for lignin production, for improving

conditions, for improving plant tolerance to extreme osmotic conditions, for improving plant tolerance to pathogens or peets, for yield improvement by modification of photosynthesis, for modifying seed oil yield and/or content, for whell improvement by modification of extobhydrate, nitrogen or phosphorus use and/or uptake and for yield improvement by providing improved plant growth and development under at least one stress condition. The polymucleotide may also encode a plant transcription factor. The methods and compositions of the present invention are useful in the field of biochemistry and genetics, in particular for producing transgenic plants with improved hiological characteristics such as increased yield, improved nitrogen flow, increasing plant tolerance to cold or heat, improving plant tolerance to extreme osmotic and dicusht conditions, and improving plant tolerance to plant pests or pathogens. They can also be used in physical characys of molecules, plant breeding markers, computer-based storage and arrays of molecules, plant breeding markers, computer-based storage and carrays of molecules, plant breeding markers, computer-based storage and carrays of the printed specification, but was obtained in directly considerance to the present sequence data for this patent did not for the forms.   aureus ORFO657n sequence ADW88438 containing amino acid substitutions that increase sequence similarity to ORFO190 ADW88432. The Pubrid polypeptides contain one or more epitopes for ORFO657n and ORFO190. They were designed by taking into account the similarity and differences between native ORFO657n and ORFO190 protein sequences. The invention also provides nucleic acids encoding these hybrid polypeptides, and a method for evaluating the ability of an immunogen to produce a protective immune response against Staphylococcus infection using an animal (mouse or rat) model. The hybrid polypeptides having therapeutic and diagnostic applications, such as being used to provide protective immunity against S. aureus infection, being used to generate antibodies to detect the presence of S. aureus, and being used to generate antibodies therapeutic antibodies that target S. aureus.
   The present sequence is that of a Staphylococcus aureus protein ORF0657n hybrid polypeptide. This is an example of claimed hybrid polypeptide immunogens of the invention ADW88439-ADW88474 that comprise a modified S.

frames in the complete genome (see AAX91990) of Chlamydia pneumoniae. C. pheumoniae causes respiratory disease such as pneumonia and bronchitis and is thought to be a contributing factor in heart disease, sarcoidosis, sinusitis, purulent otitis media, erythema nodosum or pharyngitis. The polypeptides encoded by the open reading frames of the C. pneumoniae genome (see AAY34584-Y35879) can be used in immunogenic compositions as vaccines. Vectors containing C. pneumoniae nucleotides sequences can also be used as immunogenic compositions, especially where the vector directs the expression of a neutralising epitope of C. pneumoniae. (Updated on 17-2003 to standardise OS field)
  95 VKGVPKKTPQARPEVSSPRLPSHVQHGQRLPGLEGFRDRIQKRSENPEADLGKMKRSYSD 154
  The present sequence is that of a Staphylococcus aureus protein ORF0657n hybrid polypeptide denoted 0657nHybrid3. This is an example of claimed hybrid polypeptide immunogens of the invention ADW88439-ADW88474 that comprise a modified S. aureus ORF0657n sequence ADW88433-ADW88434 that containing amino acid substitutions that increase sequence similarity to ORF0190 ADW88432. The hybrid polypeptides contain one or more epitopes for ORF0657n and ORF0190. They were designed by taking into account the similarity and differences between native ORF0657n and ORF0190 protein sequences. The invention also provides nucleic acids encoding these hybrid polypeptides, and a method for evaluating the ability of an immunogen to produce a protective immune response against Staphylococcus
   Novel hybrid polypeptide immunogen comprising modified ORF0657n sequence, useful for inducing protective immune response in humans against

2,
   The invention relates to constructing (M1) a strain of diploid fungal cells in which both alleles of a gene are modified, comprising modifying one allele by insertion or replacement by a cassette having an expressible selectable marker and modifying other allele by recombination, of a promoter replacement fragment with a heterologous promoter, so that expression of the second allele is regulated by the promoter. (M1) is useful for constructing a strain of diploid fungal cells in which both alleles of a gene are modified. The diploid fungal cells having both alleles modified are useful for identifying a gene that is essential to the survival or growth of a fungus, a gene that contributes to the virulence and/or pathogenicity of a fungus, a gene that contributes to the resistance of a diploid fungus to an antifungal agent, an antifungal dent, an antifungal
   Constructing strains for identifying gene products as effective targets for therapeutic intervention, by inactivating in the strain one allele of a gene and placing other allele of the gene under conditional expression.

and for identifying a therapeutic agent for treatment of a mammalian disease. (M1) is useful for identifying a compound which modulates the activity of a gene product, preferably enzymatic activity, carbon compound catabolism, biosynthetic, transporter, transcriptional, transluctional, aignal transduction, DNA replication and cell division activity. The method is useful for identifying a compound having the ability to inhibit growth or proliferation of C. albicans cells and for treating infection by C. albicans. The present sequence is that of an sesential Candida albicans protein used in the method of the invention. Note: The sequence data for this patent is not represented in the printed specification but is based on sequence information supplied to Derwent by the European Patent Office

rimer sets for synthesizing polynucleotides, particularly the 5602 full-sngth cDNAs defined in the specification, and for the detection and/or lagnosis of the abnormality of the proteins encoded by the full-length

WPI; 2001-318749/34.

Primer sets

length

The present invention describes primer sets for synthesising 5602 full-length cDNAs defined in the specification. Where a primer set comprises: (a) an oligo-dr primer and an oligonucleotide complementary to the complementary strand of a polynucleotide which comprises one of the 5602 nucleotide sequences defined in the specification, where the

Claim 8; SEQ ID NO 15383; 2537pp + Sequence Listing; English.

```
congonuclectide comprises at least 15 nucleotides; or (b) a combination of an oligonucleotide comprising a sequence complementary to the complementary strand of a polynucleotide which comprises a 5'-end complementary strand of a polynucleotide which comprises a 5'-end sequence and an oligonucleotide comprises a 3'-end sequence, where the oligonucleotide comprises a 1'-end sequence, where the combination of the 5'-end sequence'3'-end sequence is selected from those defined in the Specification. The primer sets can be used in antisense therapy and in gene therapy. The primer sets can be used in antisense therapy and in gene therapy. The primers are useful for synthesising polynucleotides, particularly full-length cDNAs. The primers are also useful for the detection and/or diagnosis of the abnormality of the proteins encoded by the full-length cDNAs. The primers allow obtaining of the full-length CDNAs assily without any specialised methods. AAH03166 to AAH13628 and AAH13633 to AAH1842 represent human cDNA sequences; AAB02446 to AAB05893 represent man amino acid sequences; and AAH13629 to AAH13632 represent coligonucleotides, all of which are used in the exemplification of the

The invention relates to a novel isolated polynucleotide comprising any of the 87 sequences fully defined in the specification or its mature protein-coding portion. The polynucleotide of the invention demonstrates neuroprotective, nootropic, crebroprotective and antiparkinsonian activities whilst the polynucleotides, polypeptides and compounds may be useful for treating neurological conditions including spinal cord injury, cranial or crebral trauma, stroke, harheimer's disease, anxiety, autism, Parkinson's disease, tardive dyskinesia, paralysis, seizures or memory disorders. The current sequence is that of the protein of the invention.

WPI; 2001-112197/12. N-PSDB; AAC84742. New vaccines comprising Sp128 or Sp130 polypeptides, for treating and preventing pneumococcal infections, particularly infections caused by Streptococcus, e.g. otitis media, nasopharyngeal, bronchial, lung or blood infections.

Claim 8; Page 51-54; 54pp; English.

The invention relates to novel immunogenic polypeptides, Sp128 and Sp130 from S. pneumoniae. Vaccines comprising the polypeptides are useful for the treatment and prevention of pneumococcal infections, particularly infections caused by Streptococcus, such as cititis media, nasopharyngeal, bronchial, lung or blood infections. The antigens are used as immunogenic agents to stimulate an immune response. The antisera and antibodies may also be used in diagnosing and treating pneumococcal infections. Recombinant polypeptides serve as a mechanism for stimulating production of antibodies for use in passive immunotherapy, diagnostic reagents, and

  This sequence represents a Streptococcus pneumoniae protein of the invention. The proteins (or their homologues, derivatives and/or fragments) are useful as immunogenic or antigens: Immunogenic or antigenic compositions comprising the proteins are useful for the detection or diagnostic assays. The sequences are useful for the detection or diagnostic assays. The sequences are useful for the detection or diagnosts of S. pneumoniae infection, by contacting a sample to be tested with them. Agents capable of antagonising, inhibiting or interfering with the function or expression of the protein or polypoptide are useful in medical compositions in the treatment or prophylaxis of S. pneumoniae infection. As the sequences can be used to treat S. pneumoniae infection, the suger to treat bacterial pneumonia, which has high rates in young children, the elderly, and in patients with predisposing conditions such as asplenia, heart, lung and kidney disease, diabetes, alcoholism,

   New proteins and nucleic acid molecules from Streptococcus pneumoniae, useful as medicaments for treating or preventing a disease or infection due to streptococcus bacteria, such as pneumonia, sepsis, otitis media or ear infection.
  The invention relates to a protein comprising or having at least 50% identity to any of the 2469 amino acid sequences, identified in the specification (available on a computer readable format), or its fragment, expressed from 2469 of 2489 identified DNA coding regions from the Streptococcus pneumoniae type 4 strain genomic sequence appearing as ABS56454. Also included are an antibody which binds one of the proteins, treating a patient by administering the protein, DNA or antibody (in a composition), a kit comprising first and second primers, which are the nucleic acid cited above or fragments between nucleocides 8-100 of a sequence not defined in the specification, for amplifying a target

the first primer is substantially complementary to the target sequence and the second primer is substantially complementary to the complement of the target sequence.

The first primer is substantially complementary to the complement of the target sequence, and where the parts of the primers having the target sequence, and where the parts of the target sequence to be amplified, assay comprising contacting a test compound with the protein, and determining whether the test compound binds to the protein and a Streptococcus pneumoniae bacterium, where one or more genes encoding the proteins has been rendered inactive. The proteins, nucleic acid molecules, antibody and compositions are useful as medicaments for treating or preventing a disease or infection due to streptococcus bacterial, particularly S. pneumoniae, such as preumonia, sepsies, otitis media or ear infection. They are also useful in developing vaccines, diagnostics and antibiotics. The methods are useful for identifying immunodeniant proteins. The present sequence is one of the 2469 proteins expressed by the identified coding regions from the genomic sequence. Note: The sequence data for this patent did not form part of the printed sepsitication, but was obtained in electronic format directly from WIPO at fit wideo.int/pub/published\_pct\_sequences. (Updated on 23-OCT-2003 to standardise os field)

the inventor transfer to an interest and where expression of the nucleic acid inhibits proliferation of a cell. Also included are:

(1) a vector comprising a promoter operably linked to the nucleic acid encoding a polypeptide whose expression is inhibited by the antisense encoding a polypeptide whose expression is inhibited by the antisense nucleic acid; (2) a host cell containing the vector; (3) an isolated polypeptide or its fragment whose expression is inhibited by the antisense nucleic acid; (4) an antibody capable of specifically binding the polypeptide or the fragment whose expression is inhibited by the antisense nucleic acid; (4) an antibody capable of specifically binding the polypeptide; (5) producing the polypeptide; (6) inhibiting cellular proliferation or the activity of a gene in an operon required for proliferation, (7) identifying a compound that influences the activity of required for proliferation, or that inhibits proliferation of the biological pathway in which a proliferation-required gene or the biological pathway in which a proliferation-required gene or the biological pathway in which a proliferation-required gene or the biological pathway in which a proliferation-required gene or the biological pathway in which a proliferation-required gene or the biological compound's activity; (11) a culture comprising strains in which the gene compound's activity; (11) a culture comprising strains in which the gene convolution of the strains is present in a culture or collection of strains or (13) identifying the target of a compound that inhibits provides the proliferation of an organism. The antisense nucleic acids are useful for identifying proteins or screening for homologous nucleic acids required for cellular proliferation to isolate candidate molecules for rational drug discovery programs, or for screening homologous nucleic acids required for proliferation in cells other than S. aureus, S. typhimurium, K. pneumoniae or P. aeruginosa. The present sequence is encoded by one of the target prokaryotic essential genes. Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at firewipo.int/pub/published\_pct\_sequences New antisense nucleic acids, useful for identifying proteins or screening for homologous nucleic acids required for cellular proliferation to isolate candidate molecules for rational drug discovery programs. The invention relates to an isolated nucleic acid comprising any one of Claim 25; SEQ ID NO 73670; 1766pp; English.

This invention relates to novel nucleic acids encoding hyperimmune serum reactive antigens, or fragments derived thereof. Specifically, it refers to antigens selected from peptides and serum reactive epitopse that can be used in pharmaceutical compositions that exhibit antibacterial activity. The present invention describes a composition (including the nucleic acid molecule, hyperimmune serum-reactive antigen or antibody) that is useful for manufacturing a medicament such as a vaccine, which can be used to treat or prevent barterial infections, particularly S. pneumoniae infections that cause pharyngitis, otitis media, pneumonia, bacteraemia seppis and meningitis. The antigen or its fragment may also be used for isolating, purifying and/ or identifying an interaction partner of the hyperimmune serum reactive antigen, as well as for manufacturing a functional nucleic acid selected from aptamers and from the reactive antigen sequence is a Streptococcus pneumoniae hyperimmune serum reactive antigen

```
Nucleic acid encoding antigenic peptide(s) from Streptococcus pneumoniae - or their epitope-containing fragments, useful in protective or therapeutic vaccines, and for diagnosis.
   The nucleic acid sequence encoding the Streptococcus pneumoniae protein can be useful in vaccines for inducing protective antibodies against Streptococcus pneumoniae, for treatment or prevention of infection e.g. pneumonia, otitis media or meningitis. Probes based on the nucleic acid are used to detect Streptococcus infection (by usual hybridisation or amplification methods), also for isolating Streptococcus genes or their alleloic variants. The protein can be used similarly to detect specific antibodies in standard immunossasys, especially for diagnossing or monitoring infections. Antibodies which bind the protein are used to detect corresponding antigens, to purify the protein and for passive immunisation (optionally coupled to a toxin). Vaccines are administered, e.g. by injection, orally or through the skin, typically at 0.01-1000 (especially 10-300) mu g/ml per dose
   The present sequence represents a protein from Streptococcus pneumoniae

The invention relates to an isolated polynucleotide consisting of a Streptococcus pneumoniae nucleic acid (appearing as ADC45122 and encoding SP028) one of 113 disclosed nucleic acids encoding 113 S. pneumoniae antigens. Also included are making a recombinant vector by inserting the nucleic acid into a vector, an isolated polynucleotide consisting of at recombinant host cell comprising the SP028 mucleic acid, and a recombinant host cell comprising the SP028 polynucleotide. The nucleic acids are useful as DNA vaccine against Streptococcus pneumoniae infection (e.g. pneumonia). Nucleic acids derived from the S. pneumoniae antigen nucleic acids are useful as probes for use in diagnostic methods for detecting S. pneumoniae gene expression. The present sequence represents an S. pneumoniae antigenic protein.
   Novel polynucleotide encoding Streptococcus pneumoniae polypeptides useful for producing vaccines for prevention or attenuation of infection by Streptococcus pneumoniae.

  ABQ84792 to ABQ84904 represents nucleic acids which encode the Streptococcus pneumoniae antigens given in ABP54557 to ABP54669. The S. pneumoniae antigens have antibacterial activity and can be used in vaccines. The S. pneumoniae antigens can also be used to prevent or attenuate a Streptococcal infection in an animal. The polymucleotides encoding the S. pneumoniae antigens can be used to detect Streptococcus nucleic acids. ABQ84905 to ABQ85130 represent primers used in the cloning of S. pneumoniae ORPs (open reading frames) which are used in an example from the present invention

  54 IKPVFKKIREKKEE-----ENKPTFDVSKKKDNPQVNHSQLNESHRKEDLQR 100
  The present invention relates to the protection against malaria. More particularly, the invention pertains to a family of MSP-3 (merozoite surface protein 3)-like genes (MSP-3-1, MSP-3-3, MSP-3-3, MSP-3-4, MSP-3-5, MSP-3-6, MSP-3-7, and MSP-3-6) located on chromosome 10 of Plasmodium falciparum, highly conserved in P. falciparum strains, simultaneously
   expressed in P. falciparum at the erythrocytic stages and encoding proteins which have a Asn-Leu-Arg-Asn or Asn-Leu-Arg-Lys signature at their N-terminal extremity and which are located at the merozoite surface. The characterization of this gene family enables the definition of immunogenic and vaccine compositions against P. falciparum. The present sequence is the P. falciparum MSP-3-1 protein.
   P. falciparum merozoite surface protein 3, amino acid residues 212-380.

   The present invention describes proteins and their fragments (I) encoded by chromosome 2 of the human malarial parasite, Plasmodium falciparum. Also described are: (I) nucleotide sequences (II) encoding (I); and (2) vaccines against P. falciparum infection comprising (I) or (II). (I) and (II) are useful for the development of vaccines against P. falciparum infection. (I) and polyclonal antisera or a monoclonal antibody raised to immunogens comprising the sequences of (I), are useful in the detection of infection with P. falciparum. Furthermore, (I) (especially when they are rifins or secreted or membrane proteins) can aid the identification of infection with P. falciparum. Falciparum infection, or they can be used to dentify drug resistance IP. falciparum infection, or they can be used to dentify drug resistance IP. Falciparum. Sequencing of the Plasmodium chromosome 2 and the subsequent identification of proteins concoded by it will help to expand our understanding of parasite biology, a process hampered by the complexity of the parasitic lifecycle, and concoded by it will help to expand our understanding of parasite biology, a process hampered by the complexity of the parasitic lifecycle, and provide new targets for vaccine and drug development. Parasite resistance to malaria in many parts of the world, and there is a pressing need for vaccines and new drugs. The present invention relates to a method for identifying candidate proteins in pathogens useful as anti-infectives. The invention discloses a computational method which involves the calculation of several sequence attributes and their subsequence analysis results in the identification of outlier proteins in different pathogens. The method is useful for the identification of outlier proteins (e.g. virulence proteins, antigens or proteins used as drug targets) in jathogenic organisms. The method of the invention provides reproducible results as it does not depend on the variable blochemical characterisation of proteins. ABO21500-ABO213617 represent outlier proteins identified from different pathogenic organisms

The present invention describes an isolated and or purilled transcribes an immunogenic peptide. Also described: (1) a primer or detection probe an immunogenic peptide. Also described: (1) a primer or detection probe to hybridisation with a target sequence or the amplicon generated from a target sequence of at least 8-30, 35, 40, 45, 50, 55, 60, 65, 70, 75, 80, 85, 90, 95 or 100 consecutive nuclectides of any of the polynuclectide sequences as described above; (2) a DNA chip of the polynuclectide sequences described above; (3) a vector comprising any of the polynuclectide sequences described above; (3) a vector comprising a promoter operably linked to any of the nucleic acid sequences described above; (4) a host cell transformed by the vector of sequences described above; (4) a host cell transformed by the vector of carrier and the polynuclectide described above; (5) a method of inducing an immune response; (7) an isolated of the composition of (5) to induce an immune response; (6) a method of inducing composition of (5) to induce an immune response; (7) an isolated pythe polypeptide of (7); (9) a method of detecting P. falciparum in biological samples comprising ontacting a biological sample with the polypeptide of (7); (9) a method of detecting P. falciparum in biological samples, comprising the polypeptide of (7) to an individual to induce an immune response in the individual; (11) an enthod of eliciting an immune response in the individual; (11) an enthod of a composition comprising the polypeptides of (7) to an individual to induce an immune response in the individual; (11) an antigen-antibody that specifically binds to the P. falciparum polypeptide of (7) and detecting the presence of an antigen-antibody that specifically binds to the P. falciparum antigens of an individual composition comprising the polypeptide of composition of compositions and immunogenic peptides have the sample. The P. falciparum antigens and composition as an immune peresent invention are useful for inducing an immune persent inventi
   represents a P. falciparum antigen amino acid sequence, which is used in
the exemplification of the present invention.
  New isolated and/or purified Plasmodium falciparum polynucleotide sequences, useful in inducing an immune response for preventing and/or treating cancer and infectious diseases, such as AIDS, hepatitis, and bacterial infections.

infections. The present sequence

Sequence 1791 AA;

The invention relates to the isolation of novel genes (ACP3446-ACP34559) encoding proteins (ABR64180-ABR64281) involved in the process of anglogenesis. The nucleic acid molecules are useful in identifying and/or obtaining full-length human genes involved in an anglogenesis process. The nucleic acid molecule, polypeptides or complexes encoded, cells or the screening of candidate pharmaceutical from these are useful for the area of candidate pharmaceutical compounds used in treating anglogenesis-related disorders. They are also useful for diagnosing, prognosticating or treating an anglogenesis-related disorder, which involves uncontrolled or enhanced anglogenesis or is a disorder in which a decreased vasculature is of benefit (e.g. cancer, rheumatoid arthritis, diabetic retinopathy, psoriasis or cardiovascular diseases such as atheroscierosis), or involves inappropriately arrested or decreased anglogenesis or is a disorder in which an expanding vasculature is of benefit (e.g. ischemic limb disease or coronary artery disease). The modulator of expression or activity of the polypeptide encoded by the treatment of an anglogenesis-related disorder. This sequence corresponds to one of the novel anglogenic protein

The invention relates to a combination comprising cDNAs that are differentially expressed in response to steroid treatment. Also included are the following: a high throughput method for using a cDNA to detect differential expression of nucleic acids in a sample; and a high troughput method of screening molecules or compounds to identify a ligand that specifically binds a cDNA. The sample is from a subject with wilson disease and comparison of a standard defines a stage of that disease. The high throughput method of screening molecules or compounds to identify a ligand that specifically binds a cDNA comprises: combining to identify a ligand that specifically binds a cDNA comprises to callow specific binding; and detecting specific binding between each cDNA and at least one molecule or compound. The molecules or compounds are regulatory components. The combination is useful for preparing a composition for treating liver disorders associated with steroid therapy, e.g., cirrhosis or hepatitis. The present sequence represents a human protein which is differentially expressed in steroid-induced CDA liver cells. Note: The
  Combination useful for preparing a composition for treating liver disorders associated with steroid therapy, e.g., cirrhosis or hepatitis, comprises cDNAs that are differentially expressed in response to steroid

This invention relates to the novel association of protein sequences (and the genes which encode them) to the NP-kappaB pathway. The invention may be useful for the production of compounds with an antiinflammatory, cytostatic, hepatotropic, virucide, antiarteriosclerotic, antirheumatic, cytostatic, hepatotropic, virucide, antiarteriosclerotic, manipulation, commondulator, cerebroprotective, vasotropic, immunosuppressive or vinnerary activity or for gene therapy. The proteins and nucleotides are useful for diagnosing, preventing, treating, or ameliorating conditions or diseases associated with the NP-kappaB pathway. The condition is an immune disorder, an inflammatory disorder, an inflammatory disorder, an inflammatory disorder, an inflammatory disorder. In the papatic disorders, Hodgkin's lymphomas, hematopoletic tumours, hyper-IgM syndromes, hypohidrotic ectodermal dysplasia, X-linked anhidrotic ectodermal dysplasia, immunodeficiency, viral infections, HIV-1, HTLV-1, cetodermal dysplasia, immunodeficiency, viral infections, inflammatory bowel disease, colities, asthma, atherosclerosis, cachexia, euthyroid sick syndrome, stroke, RAB, autoimmune disorders, disorders related to hyper immune activity, disorders related to aberrant acute phase responses, hypercongenital conditions, birth defecte, necrotic lesions, wounds, organ transplant
   ä
  rejection, disorders related to aberrant signal transduction, proliferating disorders, cancers and HIV propagation in cells infected with other viruses. The present sequence is that of a human protein which is subject to the novel association with the NP-kappaB pathway of the invention. Note: This sequence does not appear in the specification but was obtained by the indexer from Genbank.

   The invention relates to isolated polynucleotide (I) and polypeptide (II) sequences. (I) is useful as hybridisation probes, polymerase chain reaction (PCR) primers, oligomers, and for chromosome and gene mapping, and in recombinant production of (II). The polynucleotides are also used in diagnostics as expressed sequence tags for identifying expressed genes. (I) is useful in gene therapy techniques to restore normal cativity of (II) or to treat disease states involving (II). (II) is useful for generating antibodies against it, detecting or quantitating a polypeptide in tissue, as molecular weight markers and as a food supplement. (II) and its binding partners are useful in medical imaging of sites expressing (II). (I) and (II) are useful for treating disorders involving abbrrant protein expression or biological activity. The polypeptide and polynucleotide sequences have applications in diagnostics, forensics, gene mapping, identification of mutations responsible for genetic disorders or other traits to assess biodiversity and to produce other types of data and products dependent on DNA and amino acid sequences. ABG00010-ABG30377 represent novel human diagnostic maino acid sequences of the invention. Note: The sequence data for this patent did not appear in the printed specification, but was obtained in electronic format directly from WIPO at (II) will prove the printed specification, but was obtained in electronic format directly from WIPO at

The present sequence is that of a Staphylococcus aureus protein ORF0657n hybrid polypeptide. This is an example of claimed hybrid polypeptide immunogens of the invention ADW88439-ADW88444 that comprise a modified S. cureus ORF0657n sequence ADW88439-ADW88443 containing amino acid substitutions that increase sequence similarity to ORF0190 ADW88432. The hybrid polypeptides contain one or more epitopes for ORF0657n and differences between native ORF0657n and ORF0190. They were designed by taking into account the similarity and differences between native ORF0657n and ORF0190 protein sequences. The invention also provides nucleic acids encoding these hybrid polypeptides, and an enchod for evaluating the ability of an immunogen to produce a protective immune response against Staphylococcus infection using an animal (mouse or rat) model. The hybrid polypeptides having therapeutic and diagnostic applications, such as being used to provide protective immunity against S. aureus infection, being used to generate antibodies to therapeutic antibodies that target S. aureus.
